

OHLCV LABS.

Proprietary trading algorithms

Agenda

01	Overview
02	Product
03	Vision
04	Target Audience
05	Traction
06	Market Size
07	Validation

- 01** An algo trading system that merges quantitative research and machine learning
- 02** Started with “Regression” which was actually taught in my curriculum at University.
- 03** I went deeper into decision trees and discovered that the same tree structure could be used in two different ways: classification trees to predict categories, and regression trees to predict numbers. From there, I moved into Gradient Boosting and eventually XGBoost.
- 04** The GOAL? : Turn cutting-edge ideas and petabyte-scale data into bleeding edge models with direct trading impact & I just don’t like sitting at my laptop staring at charts so I made a system do it.

SO WHAT? WHY ML?

ML is already a part of sophisticated quants’ investing toolkit. It offers valuable modeling flexibility and has application throughout the investment process. We view the integration of ML into investing as an evolution rather than a revolution. The techniques aren’t qualitatively distinct from traditional methods, and we expect that the quantitative investment process will remain recognizable in the foreseeable future, even as the research tools that inform its components evolve. Markets make for an especially challenging environment in which to apply ML, and beneficial ML-based research calls for process discipline and finance domain knowledge. For asset owners, more flexible but more opaque analytical tools will exacerbate challenges in distinguishing strategies that add value from data artifact. Working knowledge of ML approaches and ML research best practices offer a valuable defense.

Can this be turned into an actual trading system?

What we built

This isn't an idea. There is already an entire system behind it.

04/10

Data is collected and structured centrally, transformed into multiple decision signals, passed through risk controls, and recorded at every stage for evaluation and improvement.

CURRENT STACK

VISION Turn cutting-edge ideas and petabyte-scale data into bleeding edge models with direct trading impact.

5Y - PLAN

Develop and continuously engineer variables and improve quantitative models, ML systems, and trading strategies designed to find opportunities traditional analysis may miss & Find the best resolution to positively impact the PnL.

Expand our research and fundamentals engine so that real-world information, companies, commodities, supply chains, news, and financial fundamentals can eventually be engineered into variables the models can learn from.

Initially build for funds and institutional users, proving the technology and building a measurable track record before expanding further.

Build infrastructure that is not limited to Indian markets, allowing the research and trading stack to expand across geographies and asset classes.

Scale from tracking a small universe of stocks today to building infrastructure capable of analysing every relevant listed security.

Over the long term, subject to regulatory requirements and a proven track record, expand toward managing private capital.

05/10

“We’re not betting the company on one algorithm. We’re building the infrastructure that allows us to continuously research, test, improve and deploy many strategies.”

Target Audience

06/10

Our customers today are the firms whose results we aim to compete with tomorrow.

These firms represent the institutional ecosystem and the standard of quantitative capability we ultimately aim to reach.”

Trajectory

07/10

Briefly discuss the key dates for the project.

A growing institutional market increasingly dependent on quantitative research, data and automation.

CAGR - 2026 → 2033 13.6%

VALIDATION

09/10

Vinayak Sharma

Director at BlackRock

“Focus intelligence on signals with measurable market impact rather than attempting to analyse the entire information universe. This creates a focused NLP capability that can evolve independently alongside the quantitative research and trading engine.”

Shalini Shori

Client Executive Partner at Atos

“The project has already developed into something worth presenting. The next stage should not be waiting for a ‘finished’ product, but using real conversations, institutional feedback and market exposure to guide what gets built next.”

Thank you
